CSC 175 Self-Reflection for Project Assignment

Student Name:	Katarina Liedbeck
About Yourself:	
What did you learn during this project (e.g. OOP, aspects of project management, program design, implementation, testing and/or debugging)?	I learnt a lot about how to test a program using the jUnit test classes, additionally how to code using test driven development, as we should write our tests first. I also learnt a lot about the aspect of project management, and how we are able to validate a user's choices. Finally, I really enjoyed learning how to write to a file even though it was difficult.
What was your role/contributions in this project? What part of the project did you do your best work on? How did you spend your time on this project?	I think I did my best work on validating all of the user's choices, using the do while loops and trying to catch blocks of code. I think that I also did my best work on my unit tests, and being able to implement test driven development. Because validating all of the user's choices was my best work, it was also where I spent most of my time during this project. Especially validating the user's choice for withdrawing money depending on whether their account was an instance of account or checking.
How many hours (approximately) did you spend on this project (including class time) ?	Approximately I spent about 15 hours.
Is there anything you wish you had spent more time on or done differently?	I wish I had spent more time on writing to the text file, as I could have been able to update the same text file, and use the updated currencies instead of the original.
How would you proceed on this project if you had more time.	If I had more time, I would try to change the text files so instead of using the original text file every program run, I will be able to use the updated text file from the most recent run. I also think that I would try and make the program so that the user is able to do different transactions in different accounts during the same program run.
About the Project:	
What was the most enjoyable part of the project?	The most enjoyable part of the project was being able to use the different methods from different classes. I thought it was really cool to see how we build upon each of the methods from the previous classes in the future classes
What was the least enjoyable part of the project?	Personally, I found the least enjoyable part to be implementing the different instances of account, because it waas at first very confusing. However, when I figured it out it was also very satisfying and cool to see how we could override the

	withdraw method used in account for the checking subclass.
To what extent did the project challenge you, to apply skills you learned, and/or learn new skills?	I feel like this project was very challenging, as I felt like every new skill in programming which I had learnt throughout the whole semester. It challenged me a lot through using the new skills of writing to text files, receiving information from text files, object oriented programming, using dialog boxes and more. It was very challenging in the fact that I had to fully understand each new concept in order to implement it in the program.
About Your Classmate	
Besides yourself, which student(s) in the class did you learn the most from? Explain briefly (e.g. provide example(s)). If you did not interact with classmates, you may answer “none”.	The student in the class which I learnt the most from was Chris, as he was able to thoroughly go through object oriented programming and acquire the skill of implementing it into my final project. Chris also helped me go through my program when I was fixing bugs and helped me identify where they could be coming from. For example, I had been working on the overdraft maximum for my withdraw transaction in my program for the whole day however I was not able to find where the program broke. However, when both chris and I looked at it thoroughly we were able to find it together.
