```java
public static boolean askAnotherAction(IOHandlerInterface ioh)
{
    boolean userChoice = false;
    boolean valid = false;

    do
    {
        //Ask the user if they would like to do another action.
        String user = ioh.get("Would you like to do another action? (Please type 'yes' or 'no'");

        //If user types yes or no.
        if(user.equals("yes") || user.equals("no"))
        {
            valid = true;
            if (user.equals("yes"))
            {
                return(true);
            }

            if(user.equals("no"))
            {
                return(false);
            }
        }
        //If user types in invalid response.
        else
        {
            valid = false;
            ioh.put("Invalid data, please type 'yes' or 'no'");
        }
    }
    while (valid == false);
    return userChoice;
}
```

Checking to see if the validating of asking another question works when trying to type something other than yes or no, as it does since it shows the user the message.

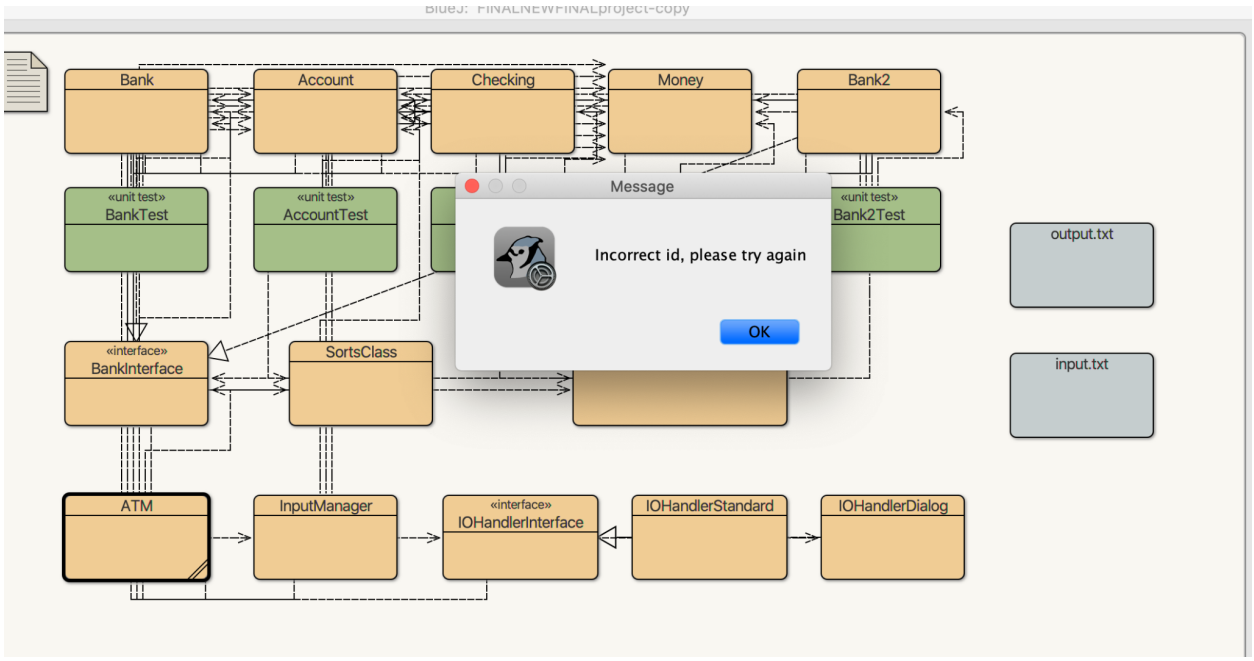

```
{
    boolean returnVal = false;
    String user = "";

    do
    {
        user = ioh.get("Please enter your ID:");

        if(user.equals("0") || user.equals("1") || user.equals("2") || user.equals("3"
        {
            returnVal = true;
        }

        else
        {
            ioh.put("Incorrect id, please try again");
        }
    } while (returnVal == false);

    return user;
}
```

Checking if the validating of the id works when typing in an incorrect id, as it does because it shows the user a message.

```
    Money withdrawAmount = new Money(dollars, cents);

    //If the account is of type regular, and the balance is less than the withdraw amount, it will throw an insufficient funds
    if(myBank.search(userID).getbalance().compareTo(withdrawAmount) == -1 && myBank.search(userID).returnAccType() == "r")
    {
        throw new InsufficientFundsException("Insufficient Funds.");
    }

    //If Account type is checking
    //If regular account balance is more than the withdraw amount or equal to
    myBank.withdraw(userID, withdrawAmount);

    //Displaying the new balance.
    ioh.put("Your account with your new balance is: " + "\n" + myBank.search(userID));

    //Write to the new updated output text file.
    myBank.writeTextToFile("output.txt");

    //Ask user to do another action .
    anotherAction = askAnotherAction(ioh);
}
catch(InsufficientFundsException ife)
{
    //If the withdraw amount goes past the amount allowed to withdraw.
    ioh.put("Insufficent Funds, you do not have enough money in your account.");
    anotherAction = askAnotherAction(ioh);
}
```

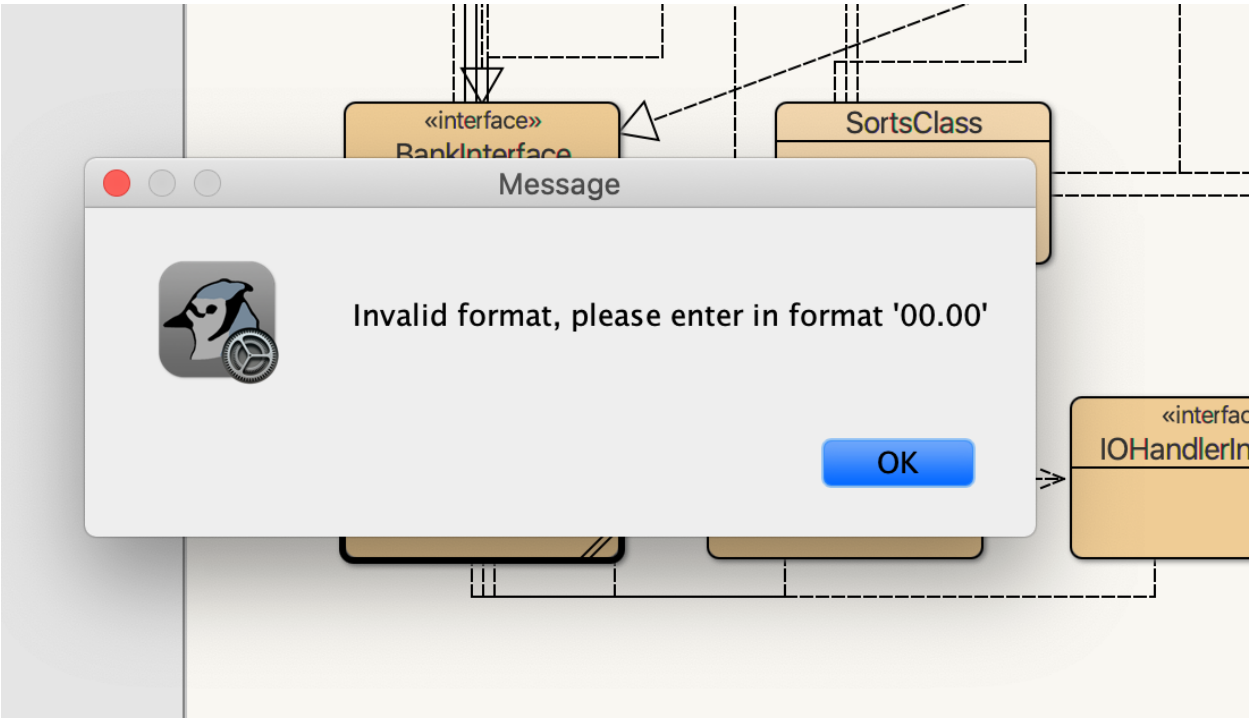

Checking if the overDraft maximum works, when withdrawing 650 from the account with a 600 dollar balance and 50 dollar overDraft, works and shows -50 on balance.
Checking if I withdraw more than the balance on both regular and checking, validating that it tells the user the amount is incorrect.

```
            {
                check2 = false;
            }
        }

        if (check1 == true && check2 == true)
        {
            returnVal = true;
        }
    }
    else
    {
        returnVal = false;
        ioh.put("Invalid format, please enter in format '00.00'");
    }
 while(returnVal == false);

eturn user;
```

Checking if the validation process for the user entering money amounts works, as it does because it shows the message.
